1. Overview

This API (Application Programming Interface) document provides the necessary connections, configurations and commands needed in order to control the SP-0108-SCL

1.1 Supported Product Firmware/Software

The following products and firmware versions are supported by this version of the API. The firmware versions listed are the minimum supported at time of publication, firmware may be higher except where otherwise noted.

Product	Status Since Last Doc Rev	Supported Product Versions
SP-0108-SCL	New	v1 or higher

1.2 Before You Begin

Verify that the following items are on hand and that all documentation is reviewed before continuing.

Operational SP-0108-SCL HDMI Splitter	
Control System and Control System Documentation	

2. Wiring and Communication Configuration

WyreStorm recommends that all wiring for the installation is run and terminated prior to making connections to the switcher. Read through this section in this entirety before running or terminating the wires to ensure proper operation and to avoid damaging equipment.

2.1 RS-232 Connections

The following wiring diagrams show the pinouts for the WyreStorm device. While not shown, connect the TX (transmit) to RX (receive) pins at the control system or PC side of the cable. Most control systems and computers are configured for Digital Terminal Equipment (DTE) where pin 2 is RX and pin 3 is TX This can vary from device to device, refer to the documentation for the connected device for pin functionally to ensure that the connect connections can be made.

RS-232 Port Settings

115200 bps
8bits
None
1bit
None

3. Command Overview

When sending commands using the IPv4 / Telnet API channel, or when using the RS-232 API channel, all command lines sent from the 3rd-party controller to the matrix should end with a specific character. This signifies when the command is processed by the matrix. This is usually specified in 3rd-party control software as the "command delimiter," "stop character," or "line terminator."

Accepted delimiter characters are:

Character	Shorthand	Hex Notation	Escape Notation	Decimal Notation
Line Feed	LF	0A	\n	10
Carriage Return + Line Feed	CR LF	0D0A	\r\n	33 10

Please note, most 3rd-party control software will either append these characters automatically or an option to specify them will be present.

It is important that the last delimiter character is LF and not CR.

4 of 10

4. Downscaler Settings

Enable/Disable Output Downscaler		
Command structure: SET DOWNSCALER <output> <prm></prm></output>	<pre><output> = out1~out8 all <prm> = on off Note: Both dipswitch and API command are capable of</prm></output></pre>	
Response Syntax: DOWNSCALER <0UTPUT> <prm></prm>		
Example Command: SET DOWNSCALER out1 on	setting downscaler, however, whichever method was used last will take precedence. If it is desired to control the	
Example Response: DOWNSCALER out1 on	on the desired setting, e.g., setting output 3 downscaler on, but dipswitch 3 is already set to the on position, simply set dipswitch 3 to off and then back to the on position and the downscaler will take effect.	

Query Downscaler Status	
Command structure: GET DOWNSCALER <output> <prm></prm></output>	
Response Syntax: DOWNSCALER <0UTPUT> <prm></prm>	<pre><output> = out1~out8 all </output></pre>
Example Command: GET DOWNSCALER out1	< PRM> = on off
Example Response: DOWNSCALER out1 on	

5. Audio Output Mute

Set Audio Output Mute		
Command structure: SET AUDOUT_MUTE <prm></prm>		
Response Syntax: AUDOUT_MUTE <prm></prm>	<prm> = on~off (on=mute, off=unmute)</prm>	
Example Command: SET AUDOUT_MUTE on	Note: Both digital and analog outputs are affected.	
Example Response: AUDOUT_MUTE on		
Query Audio Output Mute		
Command structure: GET AUDOUT_MUTE		
Response Syntax: AUDOUT_MUTE <prm></prm>	<prm> =on~off (on=mute, off=unmute)</prm>	
Example Command: GET AUDOUT_MUTE		
Example Response: AUDOUT_MUTE on		

6. Controlling Display Power via CEC

IMPORTANT! Display must be compatible with CEC and enabled to use this function.

Send CEC Display Power	
Command structure: SET CEC_PWR <output> <prm></prm></output>	
Response Syntax: CEC_PWR <output> <prm></prm></output>	< PRM> = on off
Example Command: SET CEC_PWR out1 on	Note: Sends the default hex commands to power on/off display (40 04 and FF 36)
Example Response: CEC_PWR out1 on	

Set CEC Auto Display Power		
Command structure: SET AUTOCEC_FN <output> <prm></prm></output>		
Response Syntax: AUTOCEC_FN <0UTPUT> <prm></prm>	<pre><001P01> = 0011 ~ 0018 all <prm> = on off</prm></pre>	
Example Command: SET AUTOCEC_FN out1 on	Note: Sends the default hex commands to power on/off display upon source detection (40 04 and FF 36)	
Example Response: AUTOCEC_FN out1 on		

Query CEC Auto Display Power	
Command structure: GET AUTOCEC_FN <output></output>	
Response Syntax: AUTOCEC_FN <0UTPUT> <prm></prm>	< OUTPUT> = out1 ~ out8 < PRM> = on off
Example Command: GET AUTOCEC_FN out1	
Example Response: AUTOCEC_FN out1 on	

Set CEC Power Off Delay	
Command structure: SET AUTOCEC_D <0UTPUT> <prm></prm>	< OUTPUT> = out1 ~ out8 all < PRM> = 1 ~ 30
Response Syntax: AUTOCEC_D <0UTPUT> <prm></prm>	Note: Power off timer starts upon loss of source signal
Example Command: SET AUTOCEC_D out1 5	Note 2: Delay times are represented in minutes
Example Response: AUTOCEC_D out1 5	Note 3: Default delay time is 2 minutes

Query CEC Power Off Delay	
Command structure: GET AUTOCEC_D <output></output>	
Response Syntax: AUTOCEC_D <0UTPUT> <prm></prm>	< OUTPUT> = out1 ~ out8 all < PRM> = 1 ~ 30
Example Command: SET AUTOCEC_D out1	Note: Delay times are represented in minutes
Example Response: AUTOCEC_D out1 5	

7. EDID Settings

Program Custom EDID to Input	
Command structure: SET EDID_W <prm1> <prm2></prm2></prm1>	
Response Syntax: EDID_W: <prm1> <prm3></prm3></prm1>	<prm1> = block0 ~ block1 <prm2> = one block of 256 bytes EDID ASCII data w/ spaces (HEX data must be converted to ASCII) <prm3> = ok, error (error= check sum error)</prm3></prm2></prm1>
Example Command: SET EDID_W block0 XXXX	
Example Response: EDID_W block0 ok	

Query EDID	
Command structure: GET EDID <prm></prm>	
Response Syntax: EDID <prm></prm>	<prm> = out1 ~ out8 custom in1 Note: "out1 ~ out8" query's the EDID from the respective</prm>
Example Command: GET EDID out1	output. "Custom" represents the EDID last programmed by user. "in1" represents the current EDID given to the source.
Example Response: EDID out1 XXXX	

SET CP_EDID <output></output>	
Response Syntax: CP_EDID <0UTPUT>	<output> = out1 ~ out8</output>
Example Command: SET_CPEDID out1	_
Example Response: CP_EDID out1 successful

8. Troubleshooting

Query Firmware	
Command: GET VER	<prm1> = module1</prm1>
Response Syntax: <prm1> <prm2></prm2></prm1>	PRM2> = module firmware version
System Reboot	
Command: REBOOT	
Response Syntax: REBOOT	
Restore Factory Defaults	
Command: RESET	
Response: RESET	
List of API Commands	
Command: HELP	<prm> = Gets full list of API commands</prm>
Response: HELP <prm></prm>	

9. Contacting Technical Support

Should further clarification of the content in this document or assistance on troubleshooting be required, please contact WyreStorm technical support.
